MDC 4.1 Final Patch Install Instructions

The MDC 4.1 patch can be used to upgrade MDC 4.0.1 or 4.1 Beta to MDC 4.1 final. Only use this patch if you have already downloaded and installed one of those versions and it is functioning properly. To install the MDC 4.1 Final Patch:

Step 1: Verify that MDC 4 is installed and take note of the location of the program.

Step 2: Download the file MDC41Patch.exe from the CAMD website. Once the download is complete (the file is approximately 12 MB), double-click on the file to initiate the self-extracting zip process. Unzip the files into the default folder (C:\MDC41temp) or create a new empty folder for this purpose.

Step 3: Double-click on the setup.exe file created in Step 2 to begin the install process.

Step 4: If you have an old version of an ODBC driver required by MDC, you will be prompted to exit and initiate setup.exe. in the VFPODBC subfolder. This is common on Windows XP machines. After completing that installation, start this setup again.

Step 5: You will be prompted for the directory in which you originally installed MDC 4. By default that folder is C:\Program Files\MDC4. This patch will upgrade the program files in the folder that you designate.

Step 6: Once the install is complete, start MDC 4 in the usual manner. You may be prompted during the initial startup about conflicts in table entries. Unless you have good reason not to, you should choose the "Make Selected Table Equal Reference Table" option.
